

# Tcl 9 - What about extensions and distributions?

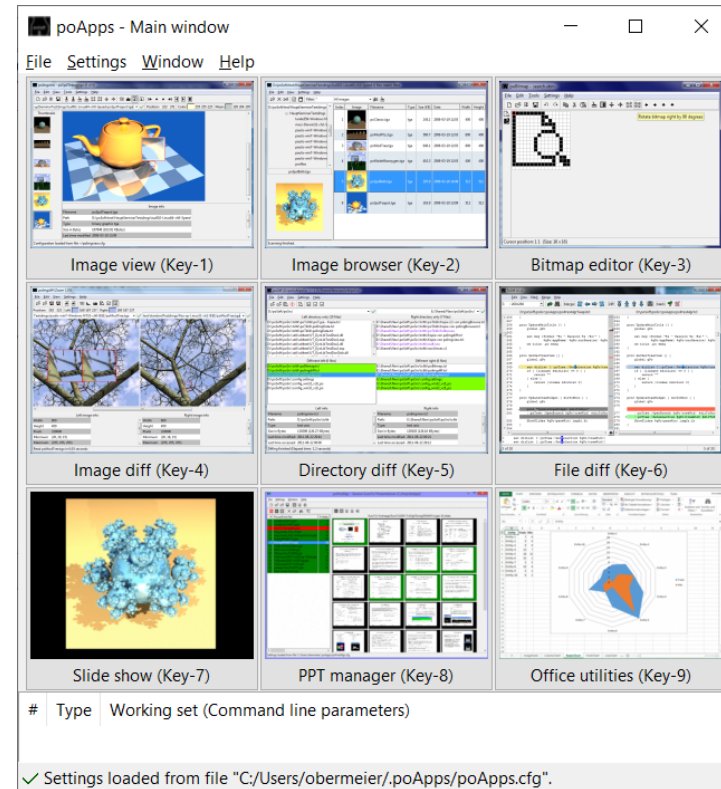

**Tcl extensions are an essential part of the Tcl/Tk eco system.**

Let's start with a few questions:

1. Who uses pure Tcl/Tk, i.e. no extensions?
2. Who uses 1 - 5 extensions?
3. Who uses more than 5 extensions?

My swiss-knife toolset poApps uses the following 13 extensions:

```
cawt pawt scrollutil tcllib tablelist  
Img tdom tclMuPdf fitsTcl poImg twapi tkdnd tksvg
```

With Tcl/Tk 9 approaching its final release soon, there is still lots of work to be done with regard to the Tcl eco system:

- Porting extensions to Tcl 9.
- Ideally: Establish an extension repository with source and binary distributions.

To start discussion and hopefully get developers on board, this talk covers the following topics:

- **Overview and current status of BAWT**
- **State of extension porting to Tcl/Tk 9**
- **Handling of extension source code and dependencies**

# BAWT - Build Automation With Tcl

- BAWT allows the automatic building of C/C++ libraries and tools on several platforms (Windows, Linux, Mac, ...).
- BAWT allows the automatic building of Tcl/Tk, Tcl extensions and Tckits on several platforms (Windows, Linux, Mac, ...).

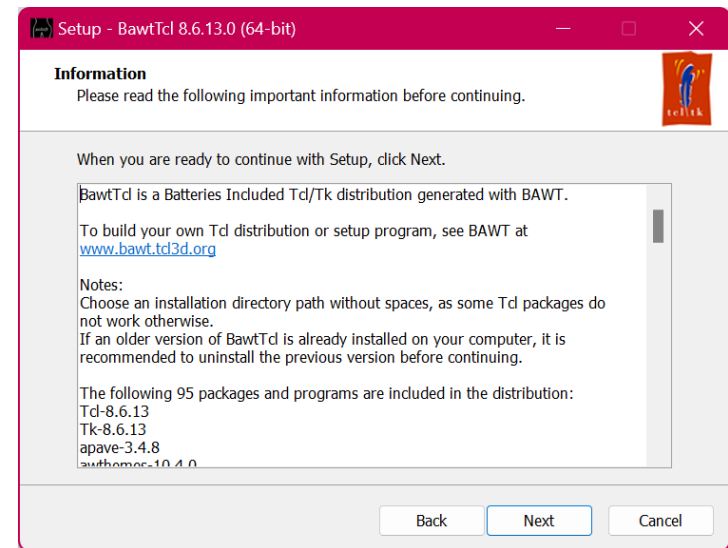

#	Build-#	Library Name	Version	Compiler	Build time	Est. time	Mod. time	Update cause	Stages
7	7	SetupPython			0.00	2.39	2020-12-22 18:42:56		
8	8	Tcl	8.6.11	gcc	0.00	7.69	2020-12-31 14:10:04		
9	9	TclStubs	8.6.11	vs	0.00	1.99	2020-12-31 14:11:43

```

# BAWT - Build scripts

*Build* files are standard Tcl script files.

Build files include the logic needed to extract, configure, compile and distribute a library.

```
proc Init_udp { libName libVersion } {
    SetScriptAuthor    $libName "Paul Obermeier" "obermeier@tcl3d.org"
    SetLibHomepage     $libName "https://sourceforge.net/projects/tcludp/"
    SetLibDependencies $libName "Tcl"
    SetPlatforms       $libName "All"
    SetWinCompilers    $libName "gcc"
}

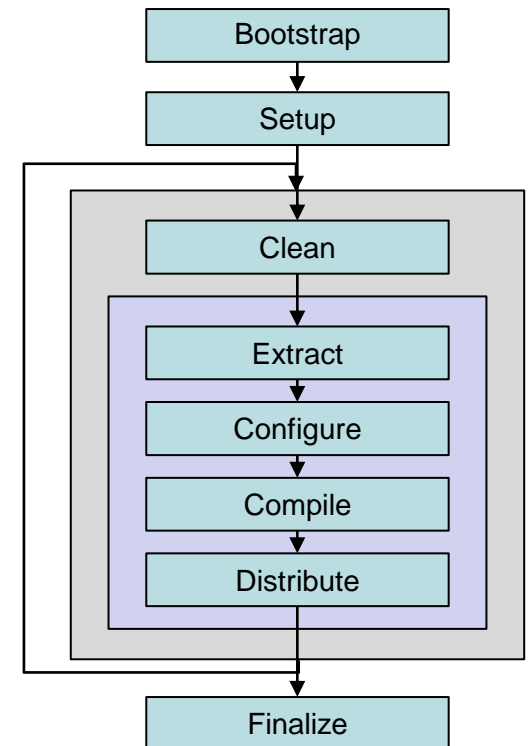

proc Build_udp { libName libVersion buildDir instDir devDir distDir } {
    if { [UseStage "Extract" $libName] } {
        ExtractLibrary $libName $buildDir
    }

    if { [UseStage "Configure" $libName] } {
        set cflags ""
        if { [GetMajor [GetGccCompilerVersion]] >= 14 } {
            append cflags "CFLAGS=\"-fpermissive\" "
        }
        TeaConfig $libName $buildDir $instDir $cflags
    }

    if { [UseStage "Compile" $libName] } {
        MSysBuild $libName $buildDir "install-binaries"
    }

    if { [UseStage "Distribute" $libName] } {
        StripLibraries "$instDir"
        LibFileCopy "$instDir" "$devDir/[GetTclDir]" "*" true
        LibFileCopy "$instDir" "$distDir/[GetTclDir]" "*" true
    }

    return true
}
```

# BAWT - Setup files

*Setup* files are standard Tcl script files. They must have one or more calls to the **BAWT** *Setup* procedure for each library being built. Optionally one or more calls to the **BAWT** *Include* procedure can be specified to add dependent libraries.

```
# Builds Tcl/Tk packages which depend on 3rd party libraries,
# like SWIG, CMake, libressl or image libraries.

Include "Tools.bawt"
Include "BasicLibs.bawt"
Include "Tcl_Basic.bawt"
Include "Tcl_Python.bawt"

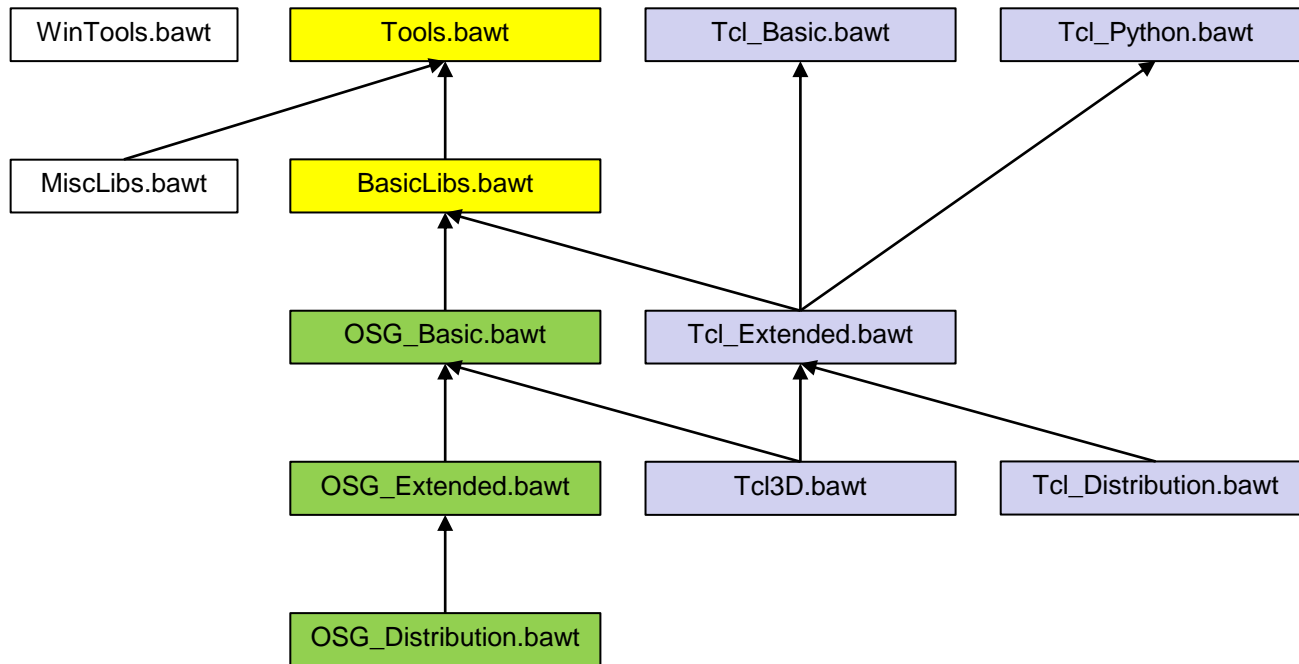

# Setup LibName          ZipFile          BuildFile          BuildOptions
Setup  mawt              mawt-0.4.4.7z    mawt.bawt
Setup  tcl3dBasic        tcl3d-1.0a1.7z   tcl3dBasic.bawt
Setup  OglInfo           tcl3d-1.0a1.7z   OglInfo.bawt

...

# MuPDF (and therefore dependent libraries tclMuPdf and MuPDFWidget)
# are not available with VisualStudio < 2017.
if { ( [UseVisualStudio "primary"] && [GetVisualStudioVersion] < 2017 ) || \
      ! [IsGccCompilerNewer "4.8.5"] } {
    Setup  mupdf          mupdf-1.18.2.7z    mupdf.bawt
    Setup  tclMuPdf      tclMuPdf-2.1.1.7z  tclMuPdf.bawt
} else {
    Setup  mupdf          mupdf-1.21.1.7z    mupdf.bawt          NoDarwin-arm
    Setup  tclMuPdf      tclMuPdf-2.3.1.7z  tclMuPdf.bawt      NoDarwin-arm
}
```

# BAWT - Setup files

The following standard *Setup* files are currently available.  
It is easy to create your own *Setup* file according to your needs.

# BAWT - Dependencies

Library dependencies are specified in *Build* scripts using `proc SetLibDependencies`.  
Library versions are specified in *Setup* scripts using `proc Setup`.

List of all libraries using command line option `--dependencies`.

# BAWT - Summary

BAWT is available from <https://www.tcl3d.org/bawt>

Current version is 2.3.1 from 2023/01/19.

New Version 2.4.0 in work supporting Tcl 8.6.14 and Tcl 9.

Tclkits for bootstrapping are available for the following platforms:

-  `tclkit-Darwin64`
-  `tclkit-Darwin-arm64`
-  `tclkit-Linux32`
-  `tclkit-Linux64`
-  `tclkit-Linux-arm32`
-  `tclkit-Linux-arm64`
-  `tclkit-Linux-riscv64`
-  `76 tclkit-win32.exe`

# Porting tools: tcl9-migrate for Tcl scripts

This software is intended to help identify changes needed for migrating Tcl 8 scripts to Tcl 9.

It has two modes of operation:

- a static analyzer based on Nagelfar that runs under both Tcl 8.6 and 9 logging warnings for potential incompatibilities.
- a runtime analyzer. This is intended to only run under Tcl 9. It attempts to fix up invalid code (e.g. encodings, tilde references) at run time allowing the program to continue to run but logs warnings to stderr.

Ashok P. Nadkarni

<https://github.com/apnadkarni/tcl9-migrate>

Tcl script to find all occurrences of Tcl C functions using `Tcl_Size` as

- Return value
- Input parameter
- Output parameter

## Typical problems with Tcl/Tk extensions

- Source code repositories are distributed over several sites:  
ex. Github, SourceForge, Chiselapp, core.tcl-lang.org, private, ...
- Lots of Tcl extensions are not actively supported.
- Official versions are seldomly released.
- No or insufficient test suites.
- No official binary distribution available anymore:  
Formerly there was ActiveTcl and teacup.  
Now only private projects available, ex. BAWT, Magicsplat, AndroWish BI, ...

These problems have been with Tcl/Tk since several years.

## Possible solutions / First steps

### Source code repositories are distributed over several sites:

Move (or mirror) all actively supported packages in a central place,  
ex. core-tcl-lang.org or Github.

Add selected packages as supported by the Tcl core like itcl, tdbc, sqlite and thread.

Possible candidates: tcltls, udp,

Add important packages as supported by the Tk core.

Possible candidates: scrollutil, tablelist, tko (as tkpath successor)

Drawback: Low release update rate of Tcl/Tk core.

### No official binary distribution available anymore:

Creating binary distributions is getting more and more difficult  
resp. expensive due to security reasons.

Official code signing cannot be done by a single OpenSource developer for multiple platforms!
